How to Call API

hum postman ki help se request kr skte hai apni api ko to test our api.

For example,
POST /users: It creates a user.
GET /users/{id}: It retrieves the detail of a user.
GET /users: It retrieves the detail of all users.
DELETE /users: It deletes all users.
DELETE /users/{id}: It deletes a user.
GET /users/{id}/posts/post_id: It retrieve the detail of a specific post.
POST / users/{id}/ posts: It creates a post of the user.
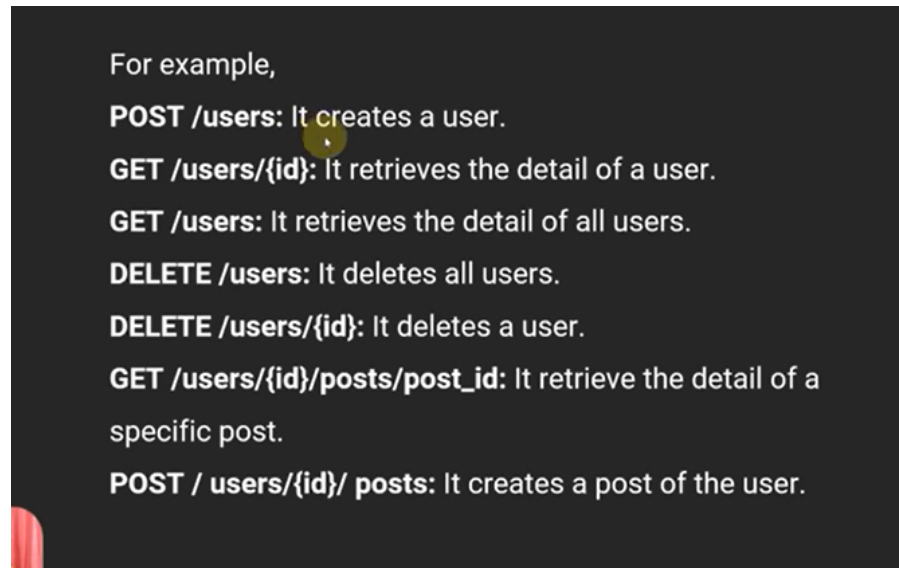

Architecture

Hum book se related operation perform krne jarhe. Hum server mai jo star hai usme coding karenge. To client kya kya chize kr skta hai: Create means new book create karega, Read means book ko read karega, single book read karega yafr sari books read karega. Ya to woh update karega jo book pehlese hai usko, yafir book delete karega.
sabse pehle hum Read implement karenga.

Postman humara client hai, to humare client ko read krna hai to yeh request karega ip/books. (ip address yafir domain name ayega waha) yeh GET/Users jaisa kam karega means sari books lake dega humko. aur server se mujhe repsonse ayega woh JOSN format mai ayega.
Server pe hume Controller banane padenge jo iss request ko accept karenge then woh process krke values ko fetch karke JSON format mai response mai denge.
